 AB - J56167798 Detergent compsn. contains (a) at least 1 anionic and/or nonionic surfactant; (b) detergent builder, and (c) modified clay prepd. by acid treating clay minerals of montmorillonite gp., having at least 45 meq./100g cation exchanging capacity (CEC) until at least 10 wt.% and below 35 wt.% Al₂O₃ component is eluted. Pref. (a), (b) and (c) are present in amts. of 2-40, 5-60 and 1-30 wt.% respectively. Pref. compsn. is particulated.
 - A particulate detergent compsn. improved w.r.t. retarding soil redeposition and causing no environmental pollution is provided.
 - When CEC is in the above range the power of the clay for combining with Ca ion in the organic components is not too high and balances adequately with its film forming properties in the water. Thus, satisfactory retardation of soil redeposition is obtd..
